

Periodic runway rubber removal was successfully carried out at Bhopal Airport on late night. This essential maintenance activity ensures continued safety of aircraft operations by removing rubber deposits from the runway surface. Rubber accumulation occurs due to aircraft landings and may reduce surface friction over time, affecting braking efficiency. To maintain optimum runway conditions, rubber removal is undertaken at regular intervals. The process helps maintain required friction levels as per international safety standards. Bhopal Airport remains committed to ensuring safe, efficient, and seamless flight operations.
